Basic Availability – Existing T-Shirt Bras

The market offers basic T-shirt bras made from smooth microfiber, stretch knit, mesh, and breathable fabrics. Most designs focus on seamless finishes, light padding, and everyday comfort, but may lack adequate support and coverage for women with larger bust sizes.

Proposed Design Solutions

The proposed designs aim to overcome these limitations through improved bust support, wider adjustable straps, enhanced coverage, breathable mesh panels, and ergonomic construction. The collection combines comfort, functionality, and aesthetic appeal for plus-size women.

01

Bra

1. Double layer moulded cup construction.
2. Laser perforated lower panels.
3. Soft elastic underband attachment.
4. Adjustable straps with sliders.
5. Snap button closure.

Seamless Brief

1. Stretch microfibre body construction.
2. Perforated side panel detailing.
3. Elastic waistband finishing.
4. Cotton gusset attachment.
5. Laser perforated Side panels.
6. Bonded leg openings.

02

Bra

1. Shaped moulded cup construction.
2. Low plunge centre gore.
3. Reinforced cup joining.
4. Adjustable shoulder straps.
5. Elasticated back band finishing.

Seamless Brief

1. Seamless stretch body construction.
2. Smooth front and back panels.
3. Soft elastic waistband.
4. Cotton gusset lining.
5. Bonded leg openings.

03

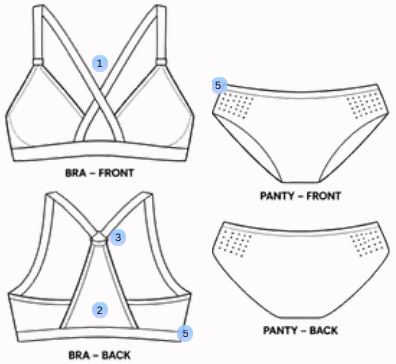
Bra

1. Double layer triangle cup construction.
2. Overlapping wrap front panels.
3. Reinforced centre front joining.
4. Adjustable wrap belt with slider.
5. Elasticated underband finishing.

Seamless Brief

1. Stretch microfibre body construction.
2. Smooth front and back panels.
3. Elastic waistband attachment.
4. Cotton gusset lining.
5. Clean bonded leg finishing.

04



Bra

1. Double layer triangular cup construction.
2. Cross over front strap attachment.
3. Reinforced strap junction.
4. Racerback strap construction.
5. Supportive elastic underband.

Seamless Brief

1. Seamless stretch fabric construction.
2. Perforated side panel detailing.
3. Bonded panel attachment.
4. Cotton gusset lining.
5. Laser perforated side panels.
6. Soft elastic leg finishing.

05

Bra

1. Three part shaped cup construction.
2. Underwire channel attachment.
3. Underwire insertion and reinforcement.
4. Scalloped lace application.
5. Adjustable straps and hook closure.

Seamless Brief

1. Stretch microfibre body construction.
2. Scalloped lace waistband attachment.
3. Smooth front and back panels.
4. Cotton gusset lining.
5. Elasticated leg openings.

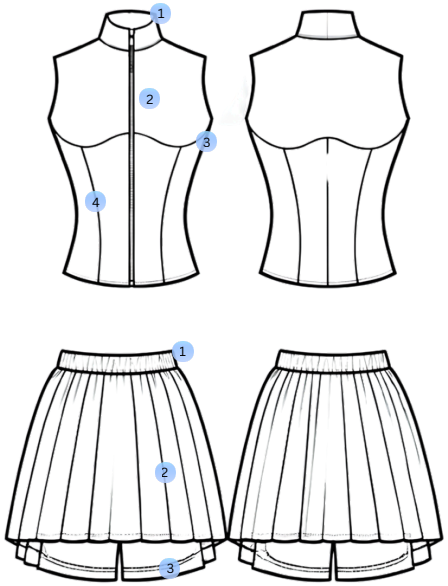
01



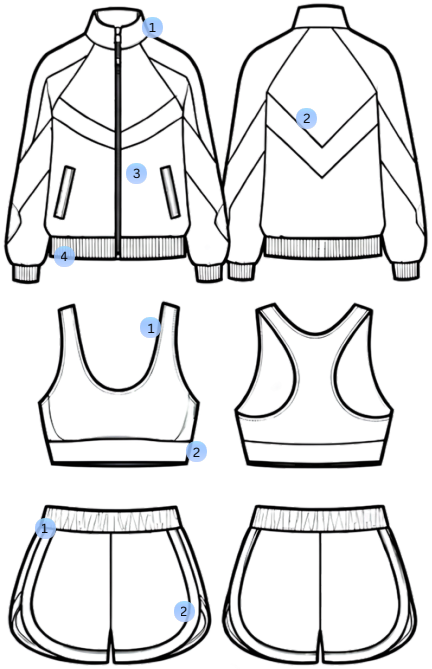
Bodice

1. Stand collar construction.
2. Centre front zipper attachment.
3. Curved colour block panel joining.
4. Princess seam construction for a fitted silhouette.
5. Clean bonded hem finishing.

Pleated Skort

1. Elasticated waistband construction.
2. Pleated outer skirt with integrated stretch inner shorts.
3. Inner shorts attached at the waistband.
4. Double layer hem finishing.

02



Jacket

1. Stand collar construction.
2. Contrast chevron panel insertion.
3. Centre front zipper attachment.
4. Welt pocket construction.
5. Ribbed knit cuffs and hem attachment.

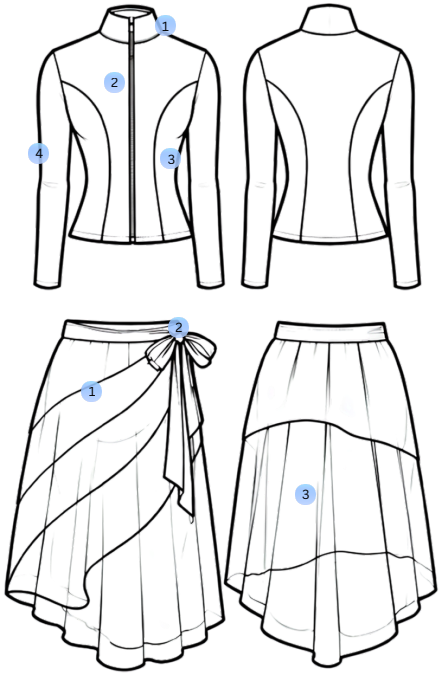
Sports Bra

1. Scoop neckline with wide shoulder straps.
2. Elastic underbust band attachment.

Shorts

1. Elasticated waistband with internal drawcord.
2. Curved side panels with contrast piping and bound hem.

03



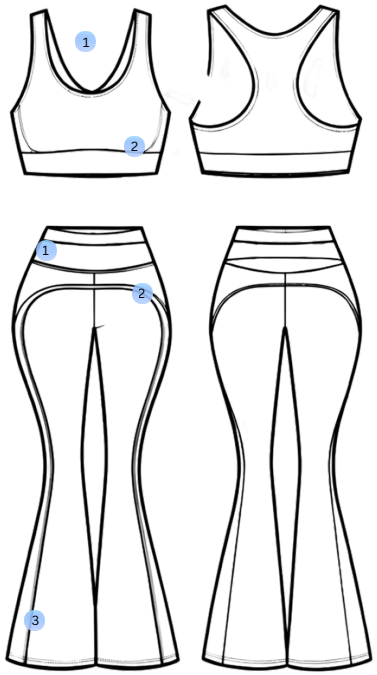
Jacket

1. Stand collar construction.
2. Centre front zipper attachment.
3. Contoured side panel joining with colour blocking.
4. Long sleeves with clean hem finishing.

Shorts with Wrap Skirt Overlay

1. Elasticated waistband construction for shorts.
2. Attached or detachable asymmetrical wrap skirt overlay with self fabric bow tie.
3. Lightweight sheer overlapping panels with rolled hem finishing.

04



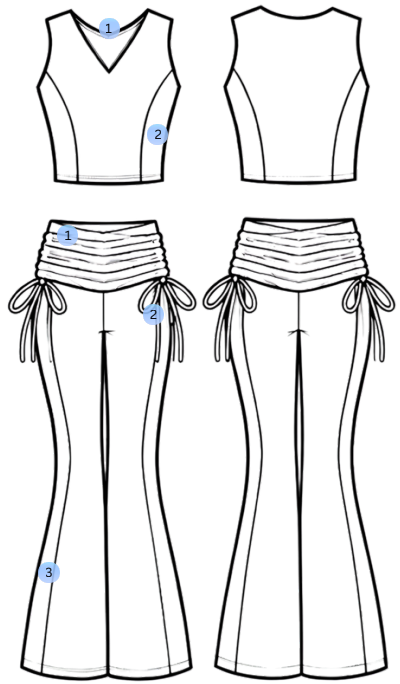
Sports Bra

1. Scoop neckline with wide straps.
2. Contrast binding and elastic underbust band.

Flared Pants

1. High contoured waistband construction.
2. Contrast piping along side and front curved panels.
3. Flared leg with clean hem finishing.

05



Top

1. V neckline construction with clean facing.
2. Contrast side panel joining with side pocket.
3. Clean cropped hem finishing.

Pants

1. Wide ruched waistband with elastic channels.
2. Adjustable side drawstrings with self fabric ties.
3. Contrast side panel insertion.
4. Flared leg with clean hem finishing.

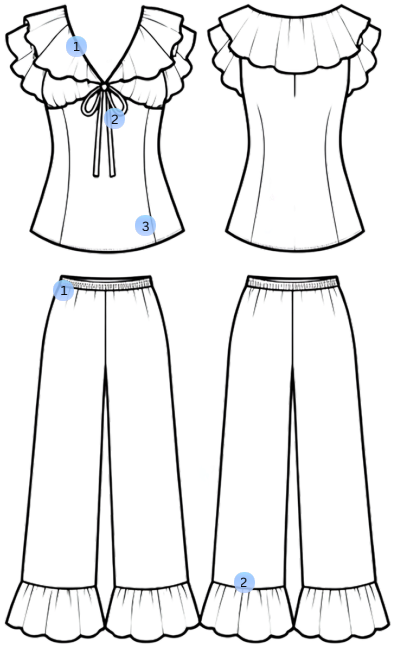
01

Dress

1. Adjustable shoulder straps with sliders.
2. Shaped lace cup construction with lining.
3. Lace insert panel joining at underbust and waist.
4. Fitted bodice construction.
5. Flared skirt with clean hem finishing.

02



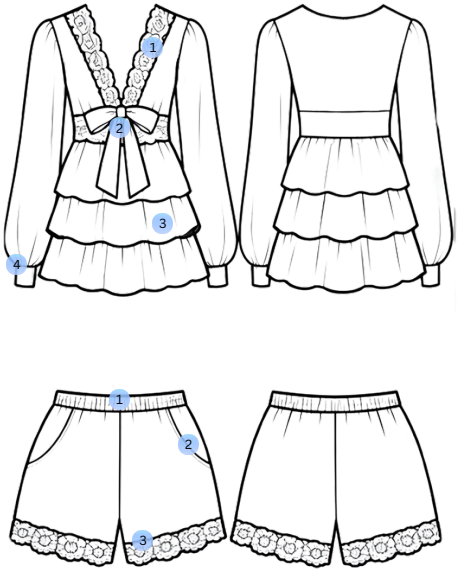
Top

1. Layered ruffle neckline and sleeve construction.
2. Centre tie string attachment with clean finishing.
3. Shaping darts or princess seams for a fitted body.

Pants

1. Elasticated waistband construction.
2. Gathered ruffle hem panel attachment.

03



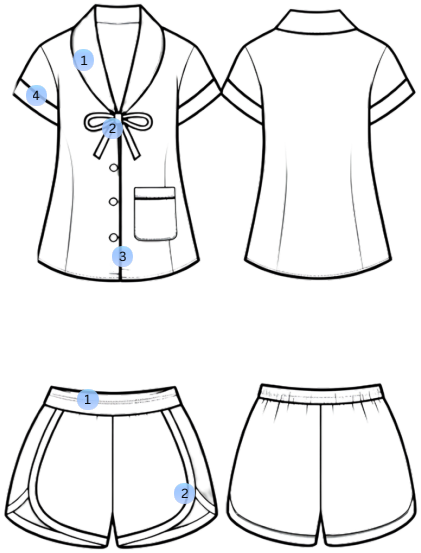
Top

1. Deep V-neckline with scalloped lace trim application.
2. Waistband with self fabric bow tie attachment.
3. Tier layered peplum panels with rolled hems.
4. Long balloon sleeves with elasticated cuffs.

Shorts

1. Elasticated waistband construction.
2. Side seam pockets.
3. Scalloped lace hem application.

04



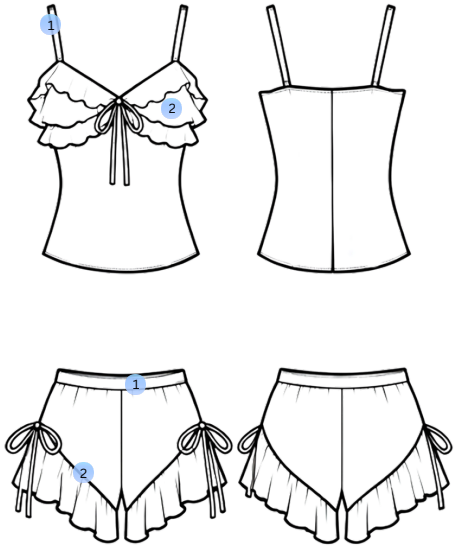
Top

1. Shawl collar construction with contrast fabric.
2. Self fabric bow tie attachment.
3. Centre front button placket and patch pocket construction.
4. Short sleeves with contrast piping.

Shorts

1. Elasticated waistband construction.
2. Contrast binding along side and hem curves.

05

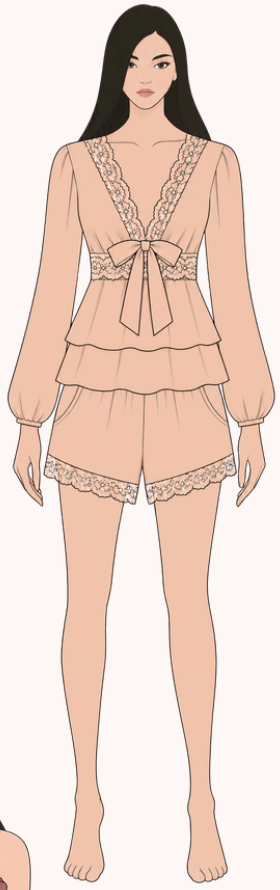


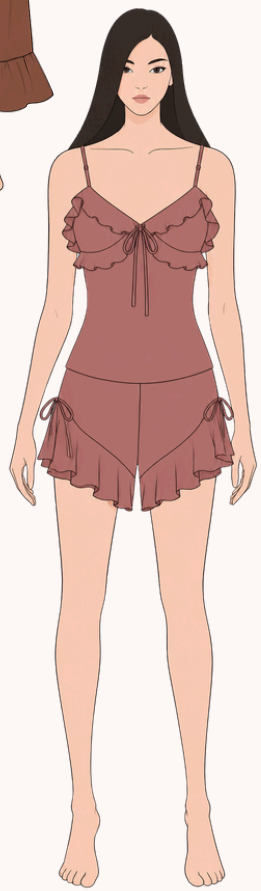
Top

1. Adjustable shoulder straps with sliders.
2. Layered ruffle panel construction at bust.

Shorts

1. Side drawstring tie attachment.
2. Asymmetrical ruffle panel construction.





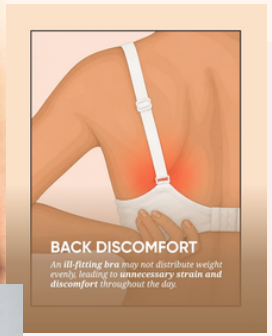
Nylon Soft Lace
70 GSM

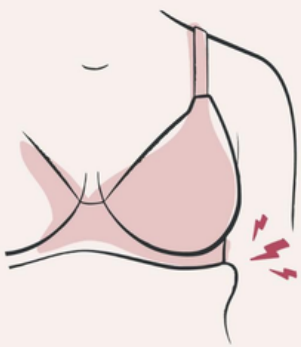
Polyester Satin
95 GSM

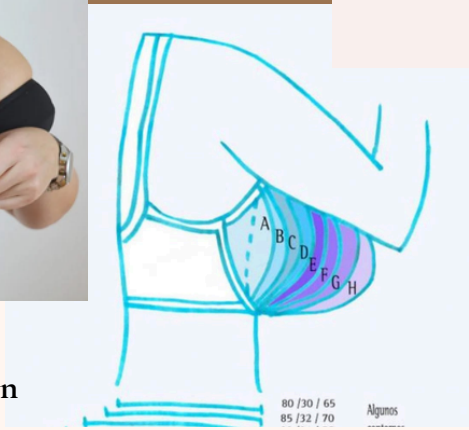
Satin Charmeuse
90 GSM

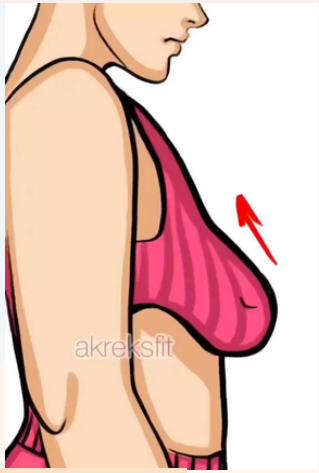
Polyester Soft Lace
60 GSM

The collection uses soft satin and delicate lace to create elegant, feminine nightwear. Lightweight, smooth fabrics provide comfort and a luxurious feel, while lace detailing adds texture, softness and a refined finish.



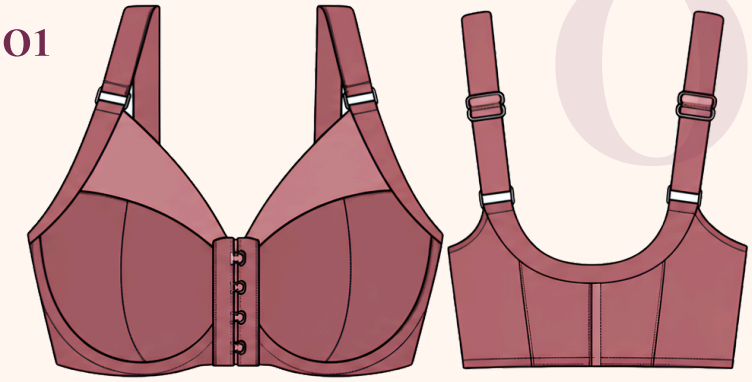






Larger bust sizes often face issues such as insufficient bust support, shoulder strap digging, excessive breast movement, underwire pressure, side bust spillage and back band discomfort. Poor weight distribution, sweating, improper cup fit and difficulty fastening also reduce comfort and confidence during daily activities.

01

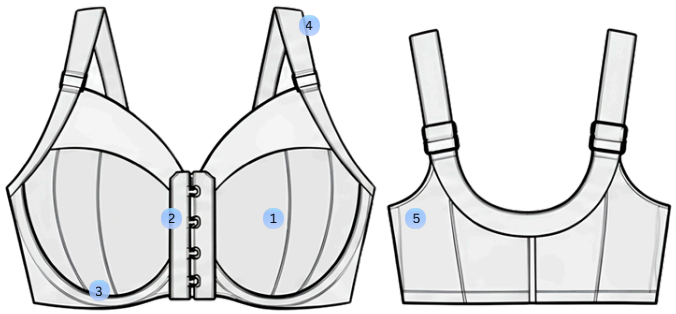


02

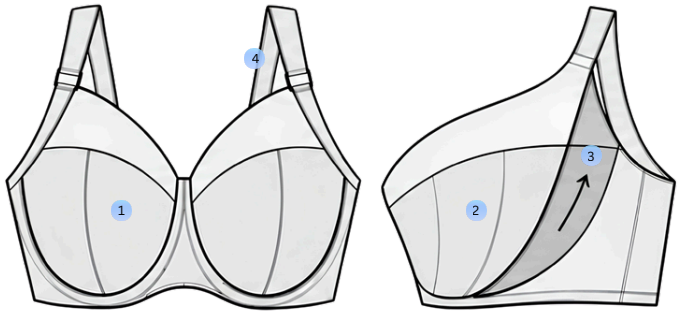
03

The designs provide enhanced support for larger bust sizes through full coverage cups, wider adjustable straps, reinforced underbands and supportive mesh panels. Ergonomic construction improves weight distribution, reduces shoulder pressure and ensures better comfort, fit and stability.

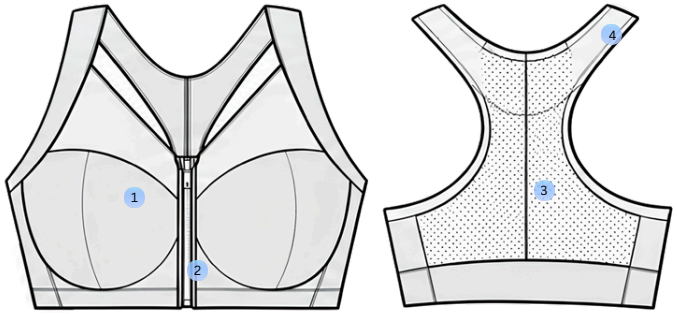
01



02



03



Design 01 – Front Close Support Bra

1. Multi panel seamed cup construction for enhanced lift and shape.
2. Front hook and eye closure for easy wearing.
3. Reinforced underwire with protective casing.
4. Wide, padded adjustable shoulder straps.
5. High supportive side wings and wide back band for better containment.

Design 02 – Side Support Lift Bra

1. Encapsulation cup construction with floral lace upper panels.
2. Full coverage cups for larger bust support.
3. Internal side sling panel for forward projection and lift.
4. Wide adjustable shoulder straps for comfort.
5. Wide back band with multi row hook closure for stability

Design 03 – High Impact Racerback Support Bra

1. Full coverage multi panel cup construction.
2. Front zipper closure for easy wearing.
3. Racerback with breathable mesh panels.
4. Wide padded shoulder straps for weight distribution.
5. Wide supportive underband to minimise movement.

05

01

Designed with structured sweetheart cups, adjustable shoulder straps and a wide supportive underband to provide enhanced bust support, lift and a smooth silhouette.

02

Features a halter style neckline with supportive moulded cups and a secure back closure, offering improved weight distribution and a stylish neckline.

03

Designed with cross-back straps and full coverage cups to improve shoulder stability, reduce strap slipping and provide enhanced support.

04

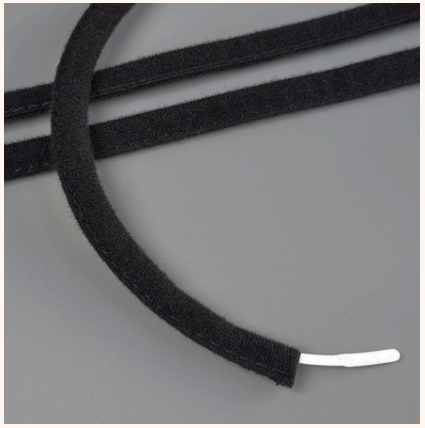
Features structured underwire cups, a wide supportive band and a secure grip construction to provide reliable lift and stability without shoulder straps.

05

An innovative one shoulder design featuring an extended supportive panel and structured cup construction, combining contemporary styling with functional bust support.

01 Underwire Digging & Rib Pressure Points

Nylon Spandex Microfibre and Spacer Mesh.



- **Problem: Underwire Digging & Rib Pressure Points**

Rigid or incorrectly shaped underwires can dig into the ribs and soft underbust tissue, causing pressure, soreness, red marks and discomfort during long hours of wear. Incorrect wire length and shape can also create pressure around the sides and under the breasts.

- **Solution: Pressure Relief Underwire System**

Introduce an ergonomically curved, flexible underwire with a cushioned wire casing and soft finished ends. A wider, supportive underband distributes pressure evenly across the ribcage, reducing digging and irritation while maintaining proper breast support and shape.

02 Strap Slippage vs. Shoulder Digging & Groove Markings

- **Problem: Strap Slippage vs. Shoulder Digging & Groove Markings**

Incorrect strap positioning, length and tension can cause bra straps to slip off the shoulders or dig into the skin. Excessive strap tension concentrates breast weight on the shoulders, resulting in painful grooves, red marks and discomfort during daily activities.

Plush back Elastic and Nylon Spandex Microfibre.

- **Solution: Adjustable Pressure Distribution Strap System**

Introduce wider, adjustable shoulder straps with soft padded sections to distribute breast weight evenly across the shoulders. Use secure strap adjusters and an ergonomic strap placement to prevent slipping while reducing shoulder pressure and groove markings.

03 Side Bust Overflow & Armpit Spillage

Mesh and Nylon Spandex Tricot.

- **Problem: Side Bust Overflow & Armpit Spillage**

Insufficient cup coverage, narrow side wings and incorrect cup construction can cause breast tissue to spill over the sides near the armpits. This creates bulging, discomfort, restricted arm movement and an uneven appearance under clothing.

- **Solution: Extended Side Support Cup System with Breathable Mesh**

Develop a bra with wider side wings, extended cup coverage and reinforced side support panels to provide secure breast containment. Incorporate higher side cups with ergonomic shaping to prevent side spillage and create a smooth silhouette. Add breathable mesh panels to improve ventilation, enhance airflow and maintain comfort during extended wear.

04 Back Band Riding Up & Poor Weight Distribution

High Compression Powernet and Microfibre Elastic.

- **Problem: Back Band Riding Up & Poor Weight Distribution**

An incorrectly fitted or loosely constructed back band can ride up towards the shoulder blades instead of staying horizontally aligned. This causes uneven breast support, excessive shoulder strap pressure, poor weight distribution and discomfort during daily activities.

- **Solution: Wide Stabilizing Back Band System**

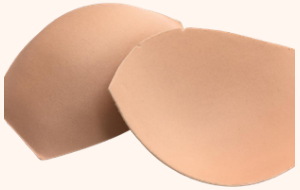
Introduce a wider, anatomically shaped back band with reinforced side panels. Position the band horizontally around the ribcage to distribute breast weight evenly and prevent riding up.

05 Cup Gapping & Shape Distortion Under Thin Outerwear

- **Problem: Cup Gapping & Shape Distortion Under Thin Outerwear**

Incorrect cup shape, excessive cup depth or poor breast to cup alignment can create empty spaces between the breast and bra cup. This causes wrinkling, gapping and visible shape distortion under thin or fitted clothing, affecting the overall appearance.

Spacer Fabric and Moulded Nylon Spandex.



- **Solution: Contoured Seamless Moulded Cup System**

Introduce anatomically contoured moulded cups with a close fitting cup shape and improved breast to up alignment. Use a smooth, structured cup construction with supportive lower panels to maintain natural breast shape, prevent gapping and create a seamless appearance under thin outerwear.

06 Center Gore Discomfort & Stemum Pinching

Brushed Microfibre and Soft Spacer Mesh.

- **Problem: Center Gore Discomfort & Sternum Pinching**

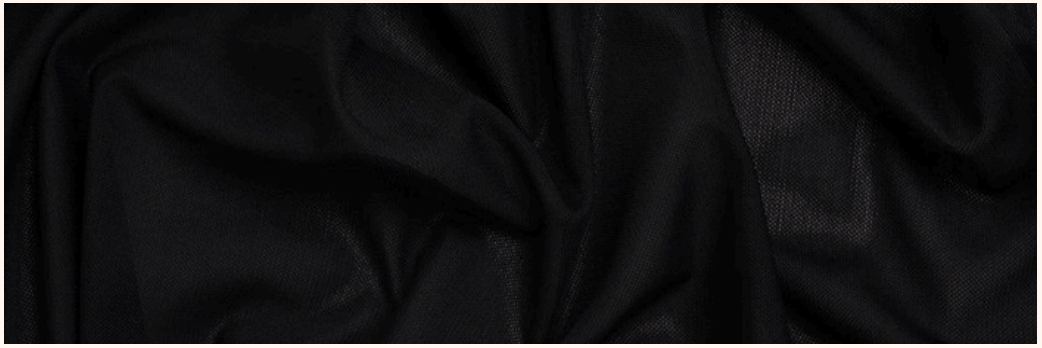
An incorrectly positioned or overly rigid centre gore can press against the sternum (breastbone), causing pain, redness and pressure between the breasts. Poor gore height and unsuitable cup spacing can also create discomfort during prolonged wear.

- **Solution: Ergonomic Flexible Center Gore Construction**

Introduce a flexible, softly cushioned centre gore with rounded edges and an anatomically shaped structure. Adjust the gore height and width according to breast spacing to minimise sternum pressure while maintaining proper cup separation and support.

07 Posture Strain & Inadequate Bust Elevation/Support

Firm Power net and Supportive Nylon Spandex.



- **Problem: Posture Strain & Inadequate Bust Elevation/Support**

Insufficient structural support, weak underbands and poorly positioned straps can cause inadequate breast elevation. This may increase strain on the shoulders and upper back, resulting in discomfort, poor weight distribution and reduced support during daily activities.

- **Solution: Ergonomic Lift & Support System**

Introduce a reinforced lower cup construction with an integrated supportive sling, wider adjustable shoulder straps and a firm stabilising underband. The ergonomic design helps lift and distribute breast weight more evenly, improving bust positioning and reducing unnecessary shoulder and upper back strain.

08 High-Movement Friction & Chafing (Under-arm & Hook Closures)

Modal Jersey, Soft Microfibre and Plush Elastic.

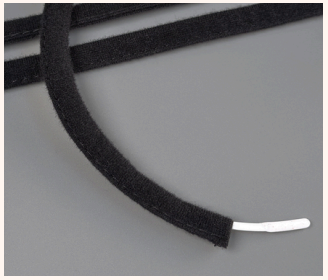
- **Problem: High-Movement Friction & Chafing (Underarm & Hook Closures)**

Repeated arm movements and body friction can cause rubbing between the bra's underarm edges, side seams and hook closures against the skin. Raised seams, rough edges and exposed fasteners may lead to redness, irritation, soreness and discomfort during daily activities.

- **Solution: Seamless Anti-Chafing Construction System**

Introduce smooth, flat locked seams with soft bound underarm edges and a concealed hook and eye closure. Use rounded closure edges and strategically positioned side panels to minimise skin contact pressure and friction during movement.

09 Hardware Irritation (Sliders, Eyelets, Wire Casing Punctures)



Brushed Tricot, Nylon Microfibre and Reinforced Powernet.

- **Problem: Hardware Irritation (Sliders, Eyelets & Wire Casing Punctures)**

Exposed or poorly finished bra hardware, including strap sliders, hook eyelets and underwire ends, can rub against the skin or puncture the casing. This may cause scratching, redness, irritation and discomfort during prolonged wear.

- **Solution: Skin Safe Concealed Hardware Construction**

Introduce smooth, rounded edge hardware with securely enclosed strap sliders and reinforced hook and eye closures. Use double layered wire casing with secured end caps and protective fabric covers to prevent metal components from coming into direct contact with the skin.

10 Fit Instability Across Monthly Body Fluctuations

Four Way Stretch Nylon Spandex and Stretch Lace Free Microfibre.

- **Problem: Fit Instability Across Monthly Body Fluctuation**

Natural hormonal changes during the menstrual cycle can cause temporary breast swelling, tenderness and changes in breast volume. A fixed size bra may feel too tight during swelling or become loose when breast volume decreases, resulting in pressure, cup spillage, gaping and inconsistent support.

- **Solution: Adaptive Fit & Adjustable Bra Construction System**

Introduce a flexible bra construction with multi position hook and eye closures, adjustable cup volume and stretchable side panels. Incorporate flexible cup shaping and adjustable straps to accommodate temporary body fluctuations while maintaining consistent support and comfort.
